

MODULE 10 WORKSHEET

Funnel Diagnosis

Find the broken stage before changing the strategy. Diagnose with evidence, then change one variable.

Completion target: calculate your acquisition funnel, identify the largest meaningful drop-off, inspect real examples from that stage, and design one controlled correction.

1. Funnel snapshot

Stage	Count	Rate
Qualified opportunities worked		-
First touches / applications sent		-
Reached / delivered / viewed where visible		
Replies / real conversations		
Positive interest		
Interviews / discovery calls		
Proposal / paid-pilot conversations		
Clients won		

Use rates only when the denominator makes sense. Do not compare unrelated channels as if they are identical.

2. What is the biggest drop?

Stage:

Why this stage matters:

3. Diagnostic tree

Observed problem	Inspect first	Your evidence
Almost nobody can be reached	Contact data, channel, timing, wrong role, invalid emails	
Reached but "not relevant"	ICP, persona, trigger, problem hypothesis	
Replies but few useful conversations	Message clarity, CTA, proof relevance	
Interest but no meetings	Qualification, scheduling friction, meeting value, response speed	
Meetings but no-shows	Expectation setting, confirmation, genuine intent	
Interviews but no offers	Proof, communication, understanding of business, scope, availability	
Proposals but no pilots	Risk, scope, pricing clarity, trust, timing, decision process	

Do not diagnose from feelings. Read the actual messages, replies, notes, recordings, and job descriptions from the weak stage.

4. Evidence review

Review a small but real sample from the weak stage.

#	Example reviewed	What happened?	Possible cause	Evidence strength
1				Low/Med/High
2				Low/Med/High
3				Low/Med/High
4				Low/Med/High
5				Low/Med/High
6				Low/Med/High
7				Low/Med/High
8				Low/Med/High
9				Low/Med/High
10				Low/Med/High

5. Root-cause ranking

Possible cause	Evidence for	Evidence against	Confidence 1-5

Most likely root cause:

Why this outranks the alternatives:

6. One-variable experiment

Variable I will change:

Old version:

New version:

Major variables I will keep stable:

Evidence window before judging:

Metric that determines keep / revert:

Directional learning thresholds from the course are roughly 30-50 well-targeted first touches before major messaging conclusions, and roughly 10-15 strong job applications before major application conclusions, unless there is an obvious quality or compliance problem.

MODULE 10 QUALITY GATE

Funnel Diagnosis - PASS / REVISE

- ☐ Funnel counts are based on real activity.
- ☐ I identified the largest meaningful drop-off.
- ☐ I reviewed real examples from that stage.
- ☐ I separated symptoms from root causes.
- ☐ I ranked possible causes by evidence.
- ☐ I selected one major variable to change.
- ☐ I defined what stays stable.
- ☐ I defined an evidence window and decision metric.

Result	PASS / REVISE
Diagnosed bottleneck
